

# More on QR

- There are other ways to calculate QR factors
  - Householder transformations
  - Givens rotations
- We discussed what Matlab calls the 'economy' QR factorization, where  $Q$  is  $m \times n$  orthogonal,  $R$  is  $n \times n$  upper triangular.
- More generally, it is written as

$$A = QR = [Q_1 \quad Q_2] \begin{bmatrix} R_1 \\ 0 \end{bmatrix} = Q_1 R_1,$$

where  $Q$  is  $m \times m$ ,  $R$  is  $m \times n$  (while  $Q_1$  is  $m \times n$  and  $R_1$  is  $n \times n$ ).

# Matlab's `qr` function

- $[Q, R] = \text{qr}(A)$ , where  $A$  is  $m$ -by- $n$ , produces an  $m$ -by- $n$  upper triangular matrix  $R$  and an  $m$ -by- $m$  orthogonal matrix  $Q$  so that  $A = Q^*R$ .
- $[Q, R] = \text{qr}(A, 0)$  produces the "economy size" decomposition. If  $m > n$ , only the first  $n$  columns of  $Q$  and the first  $n$  rows of  $R$  are computed. If  $m \leq n$ , this is the same as  $[Q, R] = \text{qr}(A)$ .
- If  $A$  is sparse:  $R = \text{qr}(A)$  computes a "Q-less qr decomposition" and returns the upper triangular factor  $R$ . Note that  $R = \text{chol}(A' * A)$ . Since  $Q$  is often nearly full, even when  $A$  is sparse, this is preferred to  $[Q, R] = \text{qr}(A)$ .

# Matlab's `qr` function

- `[Q, R, E] = qr(A)` produces orthogonal  $Q$ , upper triangular  $R$  and a permutation matrix  $E$  so that  $A^*E = Q^*R$ . The column permutation  $E$  is chosen so that  $\text{ABS}(\text{DIAG}(R))$  is decreasing. Note `[Q,R,e] = qr(A,'vector')` produces the permutations in vector  $e$  instead of matrix  $E$ .
- Other variations are available.

## Suppose $\text{rank}(A) = k < n$

- Permute columns, using "largest" columns first
- $Q^T A P = \begin{bmatrix} \tilde{R} & S \\ 0 & 0 \end{bmatrix}$ , where
- $Q$  is  $m \times m$  orthogonal,  $P$  is  $n \times n$  permutation (for columns),  $\tilde{R}$  is  $k \times k$  triangular with  $\widetilde{|r_{11}|} \geq \widetilde{|r_{22}|} \geq \cdots \widetilde{|r_{kk}|}$ ,  $S$  is  $k \times (n-k)$ .
- solution not unique  $\rightarrow$  Multiple solutions, including
  - Let  $\tilde{c} = (Q^T b)_{1:k}$
  - Solve  $\tilde{R} z = \tilde{c}$
  - Then  $x = P \begin{bmatrix} z \\ 0 \end{bmatrix}$
